

Splitport™ Plates

Splitport plates are ideal in applications where cabling is coming out of the wall and is already connected to your equipment. You do not need to disconnect the cables to install the plate. The Splitport™ plate is designed with patented keyed-tab features that holds the wall plate together to withstand pulling and pushing of cables as the installer organizes them.

By installing one plate half at a time, the cables can be pushed out of the way and allow direct access with the wall plate screw to secure the plate. Other competitor plates place the cables in front of the screw hole and block the screw hole access which makes the installation more difficult. This unique patented design eliminates having to pass each cable through the wall plate hole, disconnect each cable that is already installed, and use oversized hole plates just to fit large connector ends through.

The Splitport™ plate eliminates the need for plate connectors and provides a clean professional appearance to your custom installation. They are designed to mount directly to standard low voltage mounting brackets and backless boxes. By eliminating the connectors at the wall, the installer reduces labor and material costs and improves signal integrity thereby making your installations more competitive and reliable. Splitport™ plates are perfect for both wall and ceiling installations for audio, video, security, and office networking.

They are sold individually or in master packs of 25 and are available in industry standard colors of White, Almond, Ivory, Brown, and Black.
