- Troubleshooting

Problem	Cause	Solution
The LED is off.	The power supply voltage does not meet the requirement due to disconnection from the power supply or low voltage.	Check the power supply of the detector. Refer to "Specifications" on the page 9 for the power supply voltage.
	Incorrect detection area.	Adjust the detection area. Refer to "Detection area" on the page 10.
The LED is on even there is no person in the detection area.	A moving object exists in the detection area, such as a fluttering curtain or a swinging wall-mounted pendant.	Remove the moving object from the detection area or change the detector location.
	The temperature changes rapidly in the detection area due to a heat source, such as a radiator or air conditioner.	Remove the heat source from the detection area or change the detector location.
The LED is on but the detector does not transmit signals.	Relay contact adhesion or damage occurs due to overload.	Check the output load. Repair or replace the damaged part.
	Improper wiring.	Connect the wires for the detector correctly.
The detector fails to warm up in 60 seconds after power on and the LED blinks continuously.	A moving object exists in the detection area during the warm-up period of the detector.	Be sure that there is no moving object in the detection area during the warm-up period of the detector.
	The detector fails to work properly.	Repair or replace the detector.
